Software Engineer

Journal Entry

I chose software development because I enjoy solving complex problems and continuously learning new things. What interests me most is how technology can be applied beyond traditional software, especially in science and healthcare. I am particularly motivated by the opportunity to combine programming with fields like computational biology and medical data analysis, where software can be used to support research and improve understanding of biological systems.

Reflecting on my strengths, I have realised that curiosity, love of learning, and perseverance play a major role in my development as a programmer. Curiosity drives me to explore how systems work and to ask deeper questions when learning new concepts. Love of learning helps me stay committed to improving my skills, especially in a field that is constantly evolving. Perseverance allows me to push through challenges, such as debugging difficult problems or understanding complex topics. I also value teamwork and fairness, which help me collaborate effectively and contribute positively in group environments.

My values strongly influence the kind of developer I want to become. I value continuous learning, as it aligns with my goal of growing both technically and academically. I also value purpose, because I want my work to contribute to meaningful areas such as scientific research and healthcare. In addition, I value fairness and collaboration, which shape how I work with others and how I approach problem-solving in team settings.

In the next five years, I aim to become a skilled developer working at the intersection of technology and science, with a focus on computational biology and bioinformatics. I am particularly interested in areas such as molecular docking, virtual screening, and the computational analysis of medical imaging data. My long-term goal is to pursue a PhD and contribute to research that uses computational methods to solve biological and medical problems. I want to become a developer who is not only technically strong but also curious, collaborative, and committed to continuous growth.
